# Spatial and temporal requirements of breeding Least Terns through the use of Motus automated radio-telemetry data

# Chapter 1

## Downloading and Accessing Data

Detailed instructions for accessing and understanding data can be found in the Motus R Book, available [here](#).

### 1.1 Loading Packages

In order to download data and complete the analysis you will need a number of packages, if you do not already have them installed, follow the instructions below

```
# Install devtools to allow download of Motus R  
# packages  
install.packages("devtools")  
  
# Install motus for data download, data  
# manipulation, visualization and analysis  
install_github("MotusWTS/motus")  
  
# install motusClient for data download  
install_github("MotusWTS/motusClient")  
  
# install packages for analysis  
install.packages("ggmap")  
install.packages("tidyr")  
install.packages("gridExtra")  
install.packages("ggplot2")  
install.packages("viridis")  
install.packages("knitr")  
install.packages("pander")
```

Once packages are installed, load them into your project

```
# load motus package  
library(motus)
```

### 1.2 Data Download - project 132

Downloading data from Motus requires you to enter your Motus username and password, you will only have access to data for projects to which you are registered. To register with Motus visit <https://motus.org/>.

To download data for the **first time** to your working directory:

```
proj.num <- 132
sql.motus <- tagme(projRecv = proj.num, new = TRUE,
  update = TRUE)
```

To update an existing sql.motus file to your working directory:

```
proj.num <- 132
sql.motus <- tagme(projRecv = proj.num, new = FALSE,
  update = TRUE)
```

## 1.3 Accessing Data

To analyze data, we'll convert the sql data file into a flat file, and only keep relevant columns and Least Tern tags. At the same time we make a new column for receiver latitude and longitude consisting of the gps latitude if available, infilled with the deployment latitude if gps is not available.

```
tbl.alltags <- tbl(sql.motus, "alltags") # convert sql file to a tbl
df.alltags <- tbl.alltags %>%
  mutate(recvLat = if_else((is.na(gpsLat)|gpsLat == 0), # create new lat/lon variables
    recvDeployLat, gpsLat),
    recvLon = if_else((is.na(gpsLon)|gpsLon == 0),
    recvDeployLon, gpsLon)) %>%
  #remove unnecessary columns
  select(-ambigID, -tagProjID, -sigsd, -noise, -freq, -freqsd, -slop, -burstSlop,
    -done, -bootnum, -tagType, -codeSet, -mfg, -tagModel, -tagLifespan,
    -nomFreq, -pulseLen, -markerNumber, -markerType, -tagDeployAlt,
    -tagDeployComments, -fullID, -recvDeployAlt, -antHeight, -speciesFR,
    -speciesSci, -speciesGroup, -tagProjName, gpsAlt, recvSiteName) %>%
  filter(speciesEN == "Least Tern") %>% # keep only LETE
  collect() %>%
  as.data.frame %>% # convert tbl to data.frame
  # convert times to datetime
  mutate(ts = as_datetime(ts, tz = "UTC", origin = "1970-01-01"),
    tagDeployStart = as_datetime(tagDeployStart, tz = "UTC", origin = "1970-01-01"),
    tagDeployEnd = as_datetime(tagDeployEnd, tz = "UTC", origin = "1970-01-01"))
```

## 1.4 Cleaning Data

Projects with receivers in the tagging area are 31, 65, 120, and 132, so we will begin by keeping all detections for receivers registered to those projects. For all other projects we'll remove any detections with a runLen < 2 as these are likely false positives. Each time we identify a false positive we'll create a block, at the end of our cleaning process we'll add all the false positive blocks together to create a single filter to apply to all the data.

First, let's remove detections outside tagging area with a runLen of 2:

```
# create list of projects with receivers outside the tagging area
nonTaggingLocs <- unique(filter(df.alltags, !(recvProjID %in% c(31, 65, 120, 132))))$recvProjID
lete17 <- filter(df.alltags, year(ts) == 2017, # filter to only 2017 detections
  !(recvProjID %in% nonTaggingLocs & runLen == 2)) %>%
  # remove detections with a runLen < 2 for stations outside tagging area
  arrange(motusTagID, ts)
```

```
# create our first filter block
df.block.0 <- filter(df.alltags, year(ts) == 2017, recvProjID %in% nonTaggingLocs & runLen == 2)
```

Next, we'll start plotting detections to search for other false positives while creating more blocks for our final filter. We'll start with our 2017 detections by making a simple plot of all tags over time by latitude, while we're doing that we'll create a custom theme that we can apply to all plots.

```
# Create ggplot theme
th <- theme_bw() + theme(axis.text.x = element_text(angle = 45,
  vjust = 1, hjust = 1), plot.title = element_text(hjust = 0.5))
# plot all tags by latitude
ggplot(lete17, aes(ts, recvLat)) + geom_point() + geom_path() +
  facet_wrap(~motusTagID) + th
```

Our first step will be to remove tags that were never detected at the breeding site, these are **23220**, **23221**, and **23222**.

```
# remove tags 23220, 23221, 23222 and create a
# block
lete17 <- filter(lete17, !(motusTagID %in% c(23220,
  23221, 23222)))
df.block.1 <- filter(df.alltags, year(ts) == 2017 &
  motusTagID %in% c(23220, 23221, 23222))
```

Now let's take a closer look at tags that were detected outside breeding area: **23212**, **23214**, **23216**, **23219**, **23223**, **23225**, **23226**, **23227**, **23270**. First we'll plot the tags, and then look at the run lengths for any detection with a runLen < 5:

```
ggplot(filter(lete17, motusTagID %in% c(23212, 23214,
  23216, 23219, 23223, 23225, 23226, 23227, 23270)),
  aes(ts, recvLat)) + geom_point() + geom_path() +
  facet_wrap(~motusTagID) + th
```

```
# examining runLen < 5
filter(lete17, motusTagID %in% c(23212, 23214, 23216,
  23219, 23223, 23225, 23226, 23227, 23270), runLen <
  5) %>% group_by(recvDeployName, runLen) %>% summarize(n = length(motusTagID)) %>%
  as.data.frame() %>% arrange(runLen, n)
```

##		recvDeployName	runLen	n
## 1		Bolivar_Flats	2	2
## 2		Peveto Woods	2	2
## 3	San Bernard National Wildlife Refuge Headquarters		2	2
## 4		Sabine NWR	2	4
## 5		Rockport Bay Education Center	2	6
## 6		High_Island	2	8
## 7		Wisner	2	8
## 8		Scenic Galveston	2	24
## 9		Quintana	2	28
## 10	San Bernard NWR (Big Pond Unit)		2	30
## 11		Grand_Isle	2	82
## 12		Exxon Fields	2	4688
## 13		RTNJ	3	3
## 14		Swallowtail	3	3

## 15	Drasher	3	9
## 16	Wisner	3	12
## 17	Waggoners Gap	3	60
## 18	Koffler	3	72
## 19	Grand_Isle	3	120
## 20	Burntpoint	3	258
## 21	Los Vientos Forest	3	411
## 22	Exxon Fields	3	5736
## 23	Koffler	4	12
## 24	Waggoners Gap	4	12
## 25	Los Vientos Forest	4	32
## 26	Grand_Isle	4	72
## 27	Exxon Fields	4	4952

Stations that stand out as having a large number of `runLen = 3`, far outside the tagging area include: *Koffler*, *Waggoners Gap*, *Burntpoint*, and *Los Vientos Forest*. These are likely sites with a large amount of background radio noise leading to increased levels of false positives. Let's look at a few examples before removing detections at these sites from our data.

For **tag 23216**, given the amount of time and distance between detections at *RTNJ* and *Exxon Fields*, and between *Koffler* and *Exxon Fields*, these are not biologically possible flights. We will therefore remove these detections:

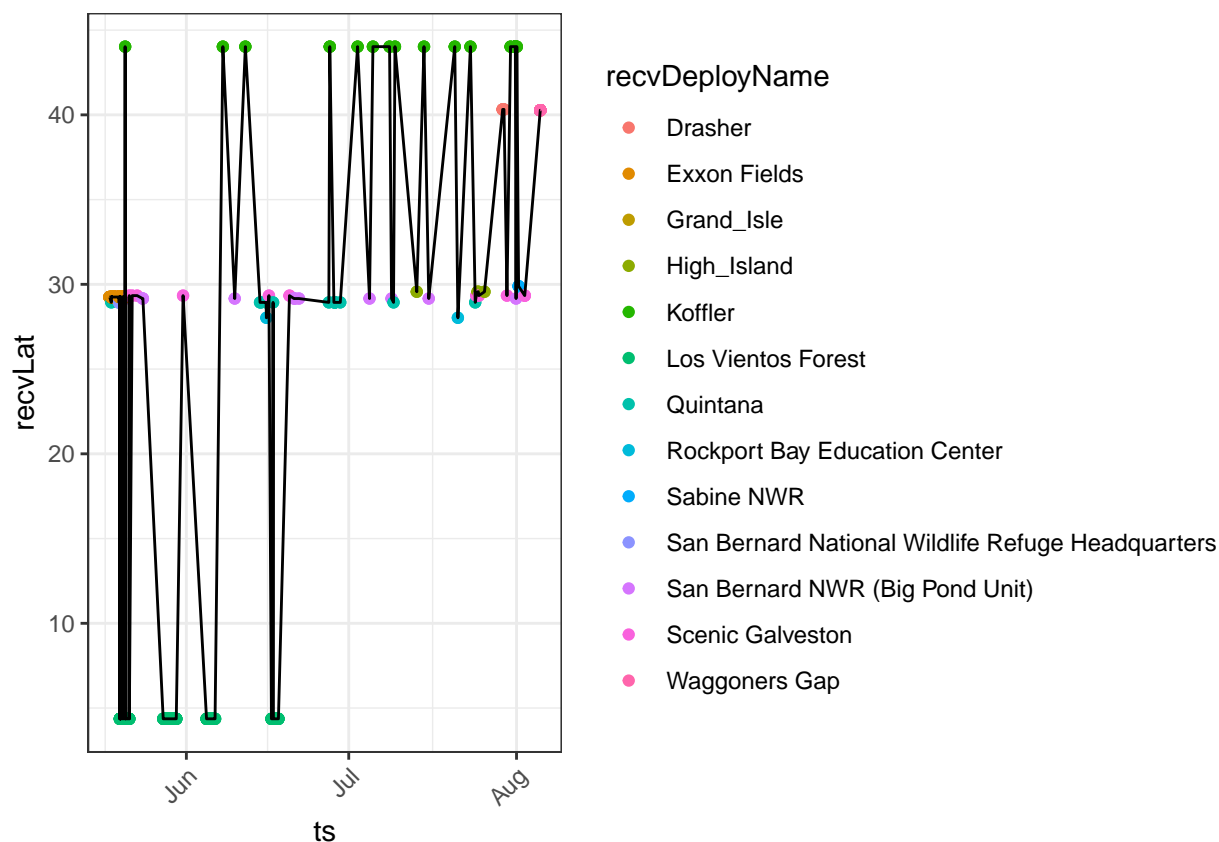

```
# motusTagID 23216
ggplot(filter(lete17, motusTagID == 23216, ts > as.POSIXct("2017-06-26")),
  aes(ts, recvLat)) + geom_point(aes(col = recvDeployName)) +
  geom_path() + th
```

For tag **23270**, it again appears there are clear false positives that can be removed at *Koffler*, *Los Vientos Forest*, *Drasher*, and *Waggoners Gap*. We will therefore remove these detections:

```
# motusTagID 23270
ggplot(filter(lete17, motusTagID == 23270), aes(ts,
  recvLat)) + geom_point(aes(col = recvDeployName)) +
  geom_path() + th
```

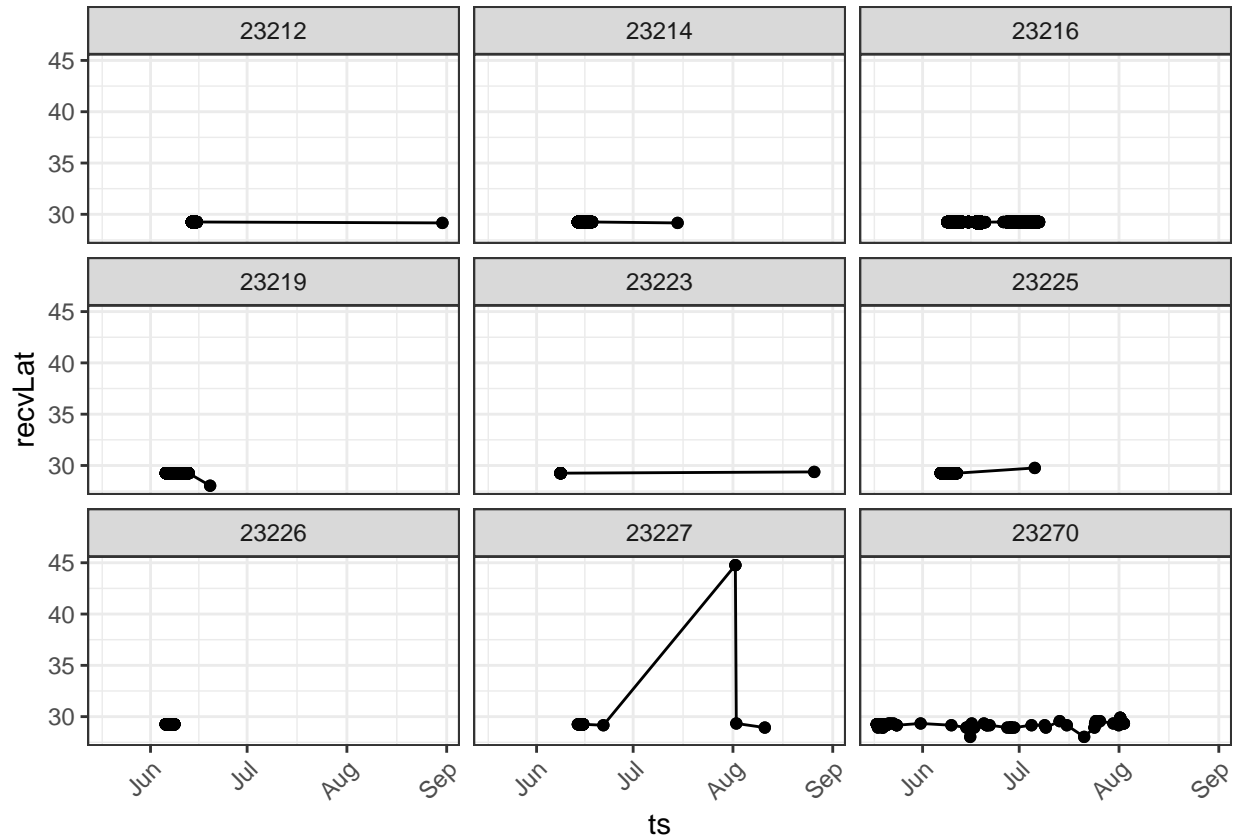

Let's create a filter block to remove these problem sites with high amounts of short runLen's:

```
df.block.2 <- filter(df.alltags, year(ts) == 2017,
  recvDeployName %in% c("Drasher", "RTNJ", "Koffler",
    "Waggoners Gap", "Burntpoint", "Los Vientos Forest"))
```

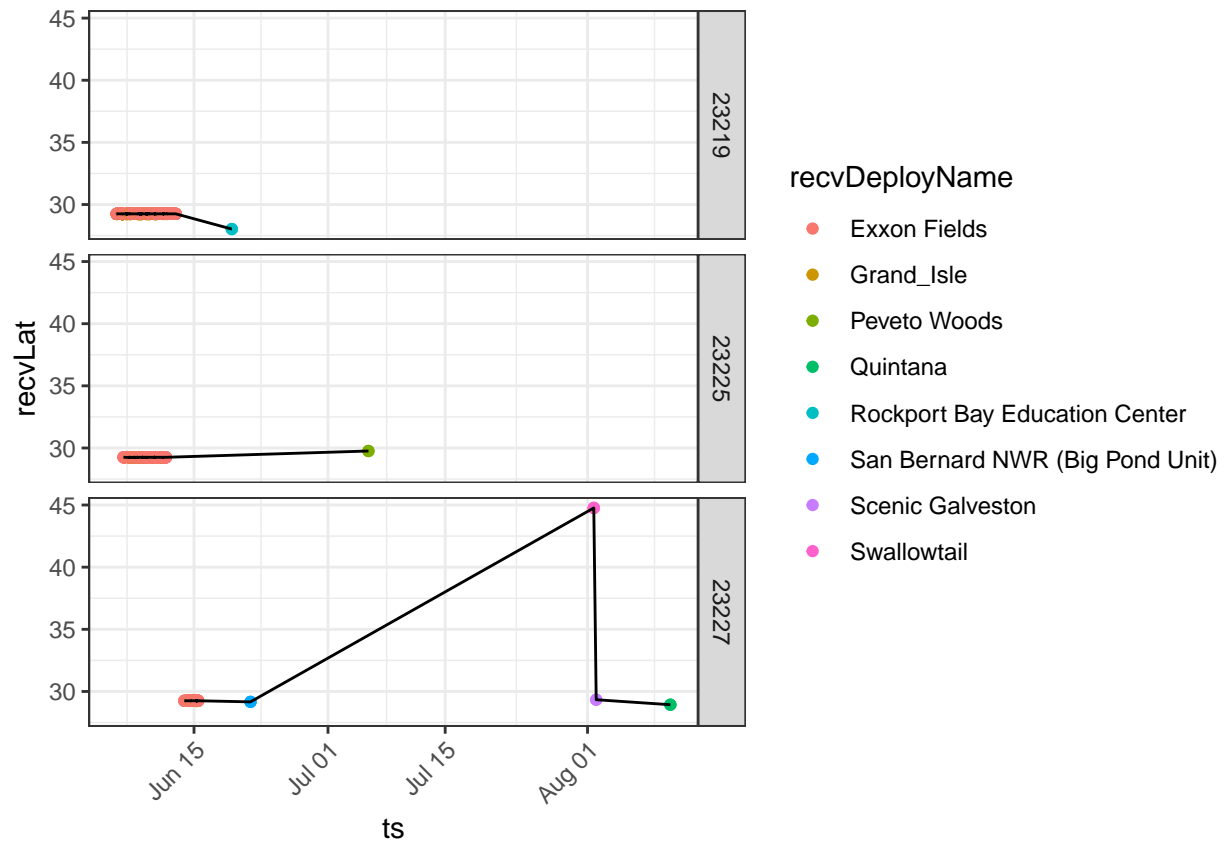

Removing the sites with a high number of low runLen's results in much cleaner plots:

```
lete17 <- filter(lete17, !(recvDeployName %in% c("Drasher",
  "RTNJ", "Koffler", "Waggoners Gap", "Burntpoint",
  "Los Vientos Forest")))
ggplot(filter(lete17, motusTagID %in% c(23212, 23214,
  23216, 23219, 23223, 23225, 23226, 23227, 23270)),
  aes(ts, recvLat)) + geom_point() + geom_path() +
  facet_wrap(~motusTagID) + th
```

Lets examine the remaining tags with questionable detections: **23219**, **23225**, **23227**:

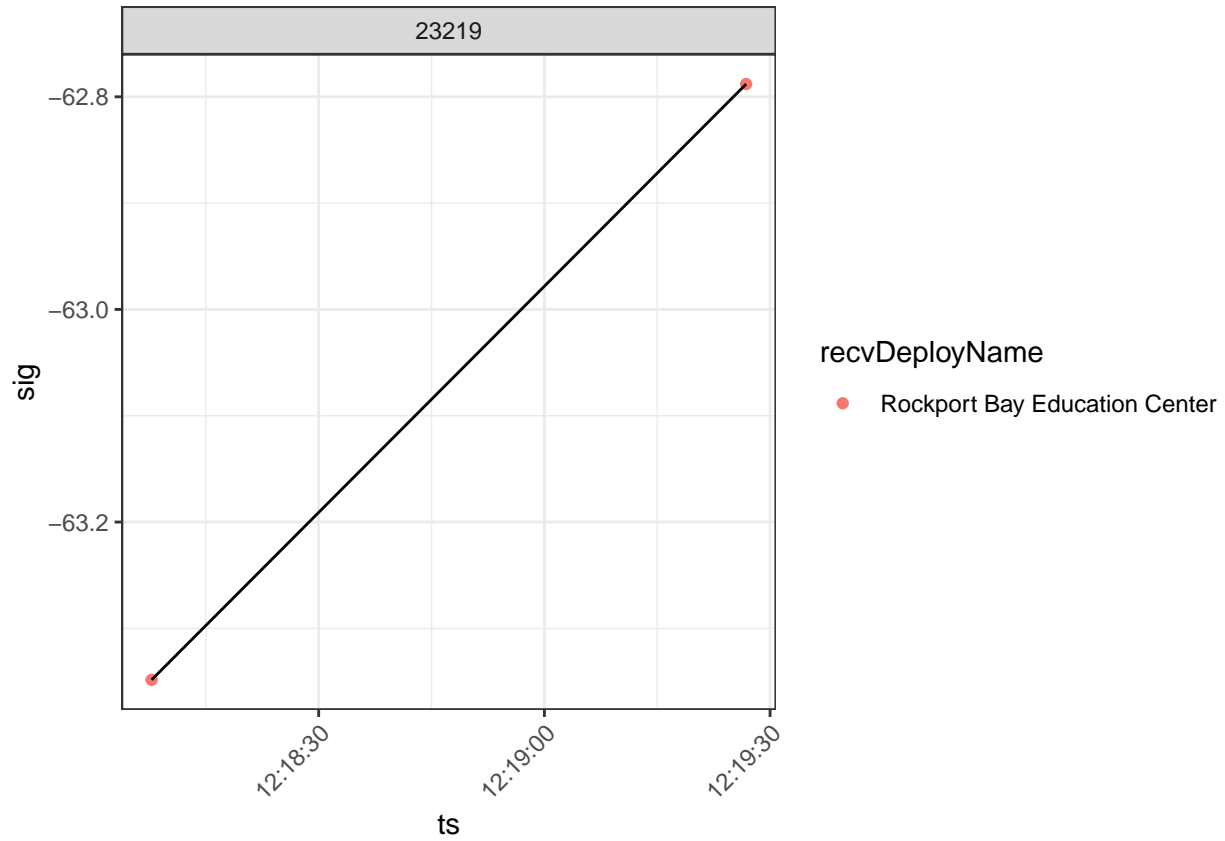

```
ggplot(filter(lete17, motusTagID %in% c(23219, 23225,
  23227)), aes(ts, recvLat)) + geom_point(aes(col = recvDeployName)) +
  geom_path() + facet_grid(motusTagID ~ .) + th
```

We'll go through each tag individually, and then create block filters at the end.

**Tag 23219:** Detections at Rockport Bay Education Center are only runLen 2, we will remove these:

```
ggplot(filter(lete17, motusTagID == 23219, ts > as.POSIXct("2017-06-18")),
  aes(ts, sig)) + geom_point(aes(col = recvDeployName)) +
  geom_path() + facet_wrap(~motusTagID) + th
```

**Tag 23225:** detections at Peveto Woods are only runLen 2, we will remove these:

```
ggplot(filter(lete17, motusTagID == 23225, ts > as.POSIXct("2017-07-02")),
  aes(ts, sig)) + geom_point(aes(col = recvDeployName)) +
  geom_path() + facet_wrap(~motusTagID) + th
```

**Tag 23227:** all detections after June 15 are of runLen 2, except for detections at Swallowtail which are too far away to be legitimate detections so we'll remove these.

```
ggplot(filter(lete17, motusTagID == 23227), aes(ts,
  sig)) + geom_point(aes(col = as.factor(runLen))) +
  geom_path() + facet_wrap(~motusTagID) + th
```

Now let's create filter blocks for those 3 tags:

```
df.block.3 <- filter(df.alltags, year(ts) == 2017,
  motusTagID == 23219 & recvDeployName == "Rockport Bay Education Center")
df.block.4 <- filter(df.alltags, year(ts) == 2017,
  motusTagID == 23225 & recvDeployName == "Peveto Woods")
df.block.5 <- filter(df.alltags, year(ts) == 2017,
  motusTagID == 23227 & ts > as.POSIXct("2017-06-15"))
```

Now let's do the same with our 2018 data, starting by removing detections from stations outside the tagging area with a `runLen < 2`:

```
# create list of projects with receivers outside the tagging area
lete18 <- filter(df.alltags, year(ts) == 2018, # filter to only 2018 detections
  !(recvProjID %in% nonTaggingLocs & runLen == 2)) %>% # remove detections with a runLen
  arrange(motusTagID, ts)
# create our first filter block
df.block.6 <- filter(df.alltags, year(ts) == 2018, recvProjID %in% nonTaggingLocs & runLen == 2)
```

Next, we'll start plotting to search for other false positives while creating more blocks for our final filter.

Plot all tags by latitude:

```
ggplot(lete18, aes(ts, recvLat)) + geom_point() + geom_path() +
  facet_wrap(~motusTagID) + th
```

Remove tags that were never detected at the breeding site: **28614**

```
lete18 <- filter(lete18, !(motusTagID == 28614))
df.block.7 <- filter(df.alltags, year(ts) == 2018,
  motusTagID == 28614)
```

Now we look closer at tags that were detected outside breeding area: **28520, 28524, 28525, 28531, 28594, 28600**

```
ggplot(filter(lete18, motusTagID %in% c(28520, 28524,
  28525, 28531, 28594, 28600)), aes(ts, recvLat)) +
  geom_point() + geom_path() + facet_wrap(~motusTagID) +
  th
```

```
## 20                                Grand_Isle      4    32
## 21                                Exxon Fields     4 1592
```

Stations that stand out as having a large number of `runLen = 3`, far outside the tagging area include: *D'Estimauville*, and as in 2017 *Koffler*. These are likely sites with a large amount of background radio noise leading to increased levels of false positives. Let's go through each of these 6 tags individually to remove false positives.

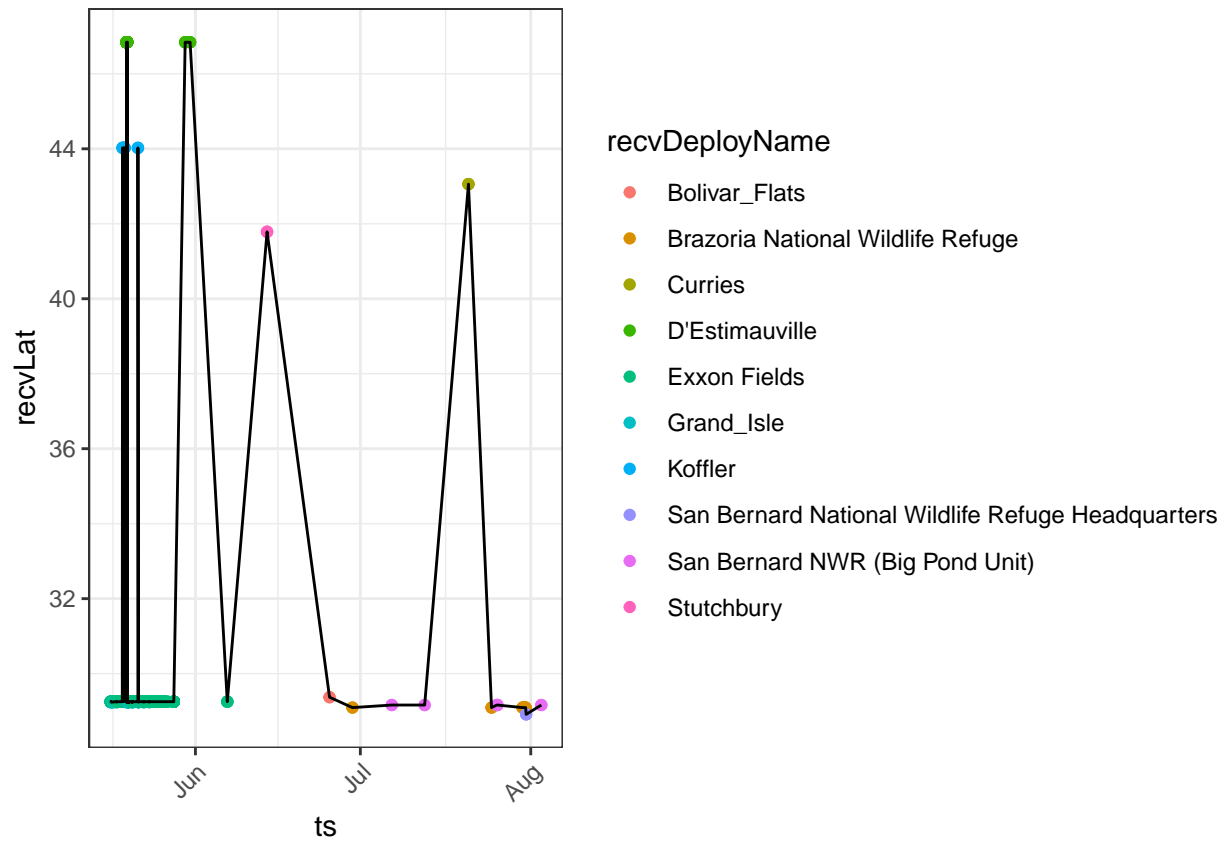

**Tag 28520:** The detections at *D'Estimauville* in Quebec are not biologically possible given the timing, and was also flagged as a noisy site, we will therefore remove these detections at the end.

```
ggplot(filter(lete18, motusTagID == 28520), aes(ts,
  recvLat)) + geom_point(aes(col = recvDeployName)) +
  geom_path() + th
```

**Tag 28524:** Given the amount of time and distance between detections at *Koffler* and *Exxon Fields*, and between *D'Estimauville* and *Exxon Fields*, these are not biologically possible flights, they were also flagged as noisy stations. The detections at Stutchbury and Curries are of `runLen 3`, and occur in Ontario and Pennsylvania respectively. We will therefore remove these detections at the end.

```
ggplot(filter(lete18, motusTagID == 28524), aes(ts,
  recvLat)) + geom_point(aes(col = recvDeployName)) +
  geom_path() + th
```

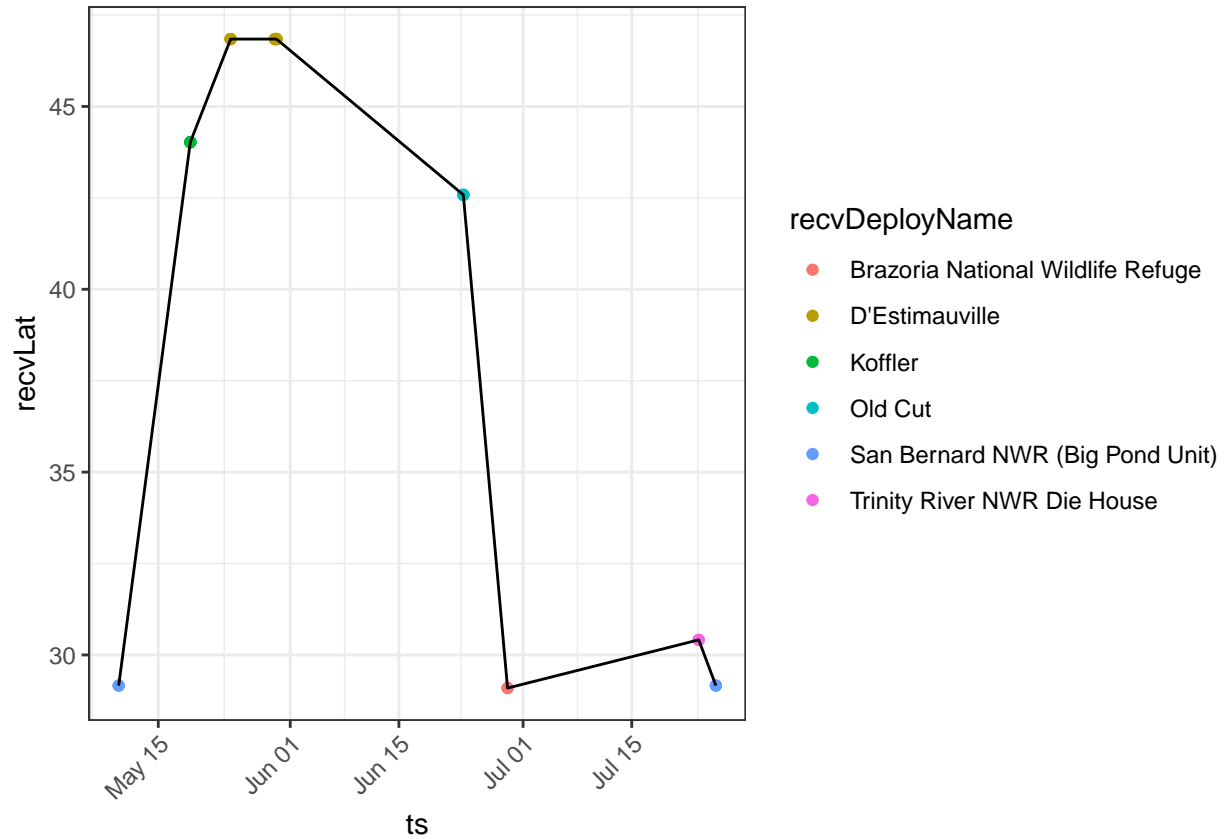

**Tag 28525:** Just as with tag 28520, the detection at *D'Estimauville* will be removed.

```
ggplot(filter(lete18, motusTagID == 28525), aes(ts,
  recvLat)) + geom_point(aes(col = recvDeployName)) +
  geom_path() + th
```

```
ggplot(filter(lete18, motusTagID == 28531), aes(ts,
  recvLat)) + geom_point(aes(col = recvDeployName)) +
  geom_path() + th
```

**Tag 28594:** Again, it is unlikely that this tag was in Ontario, Pennsylvania or Nova Scotia, and all runLen are 3, so we will remove detections at *BPLH*, *Drasher*, and *Old Cut*.

```
ggplot(filter(lete18, motusTagID == 28594), aes(ts,
  recvLat)) + geom_point(aes(col = recvDeployName)) +
  geom_path() + th
```

**Tag 28600:** Koffler and D'Estimauville once again appear problematic and will be removed.

```
ggplot(filter(lete18, motusTagID == 28600), aes(ts,
recvLat)) + geom_point(aes(col = recvDeployName)) +
geom_path() + th
```

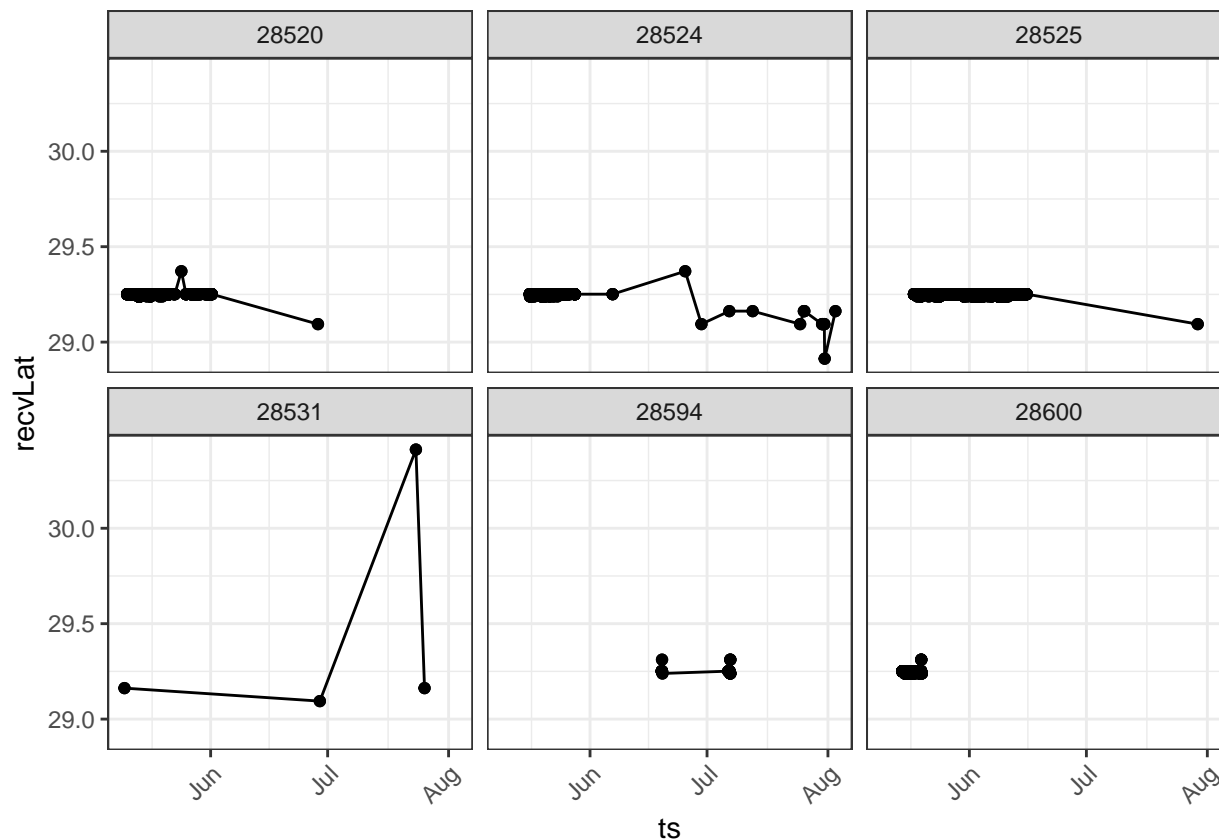

Since all false positives in these cases are for the same stations, we'll apply one filter to remove them all:

```
df.block.8 <- filter(df.alltags, year(ts) == 2018,
  recvDeployName %in% c("D'Estimauville", "Koffler",
    "Stutchbury", "Curries", "Old Cut", "BPLH",
    "Drasher"))
```

Let's see what the plot looks like after removing these detections:

```
lete18 <- filter(lete18, !(recvDeployName %in% c("D'Estimauville",
  "Koffler", "Stutchbury", "Curries", "Old Cut",
  "BPLH", "Drasher")))
ggplot(filter(lete18, motusTagID %in% c(28520, 28524,
  28525, 28531, 28594, 28600)), aes(ts, recvLat)) +
  geom_point() + geom_path() + facet_wrap(~motusTagID) +
  th
```

Now that we're happy with our filters, we can save a custom filter for all our data combined. The Motus R package offers functionalities to save your filters directly within your .motus file. Once they're saved in your database, you can do the type of `left_join` as below without having to rely on dataframes or an RDS file to store your data. More info can be found in Appendix D of the Motus R Book.

```
# Combine our df.blocks into a single data frame,
# and apply a probability of 0 for filtered
# records.
df.block.all <- bind_rows(df.block.0, df.block.1, df.block.2,
  df.block.3, df.block.4, df.block.5, df.block.6,
  df.block.7, df.block.8) %>% mutate(probability = 0)

# Create a new filter with the name filtFalsePos
# and populate it with df.block.all
tbl.filter = writeRunsFilter(sql.motus, "filtFalsePos",
  df = df.block.all, delete = TRUE)
```

```
##
## Filter records saved

# Obtain a table object where the filtered records
# from tbl.filter have been removed
tbl.alltags.sub <- left_join(tbl.alltags, tbl.filter,
  by = c("runID", "motusTagID")) %>% mutate(probability = ifelse(is.na(probability),
  1, probability)) %>% filter(probability > 0)
```

## Chapter 2

# Data Manipulation

### 2.1 Importing data if not already loaded

Since we created filters in the previous section, once those are created we can simply load the pre-filtered data as below:

```
library(motus)
proj.num <- 132
sql.motus <- tagme(projRecv = proj.num, new = FALSE, update = FALSE) # could check periodically if more
tbl.alltags <- tbl(sql.motus, "alltags")

# obtain a table object of the filter
tbl.filter = getRunsFilters(sql.motus, "filtFalsePos")

# filter and convert the table into a dataframe, with a few modications
lete <- left_join(tbl.alltags, tbl.filter, by = c("runID", "motusTagID")) %>%
  mutate(probability = ifelse(is.na(probability), 1, probability),
         recvLat = if_else((is.na(gpsLat)|gpsLat == 0), # create new lat/lon variables
                           recvDeployLat, gpsLat),
         recvLon = if_else((is.na(gpsLon)|gpsLon == 0),
                           recvDeployLon, gpsLon)) %>%

  filter(probability > 0) %>%
  #remove unnecessary columns
  select(-ambigID, -tagProjID, -sigsd, -noise, -freq, -freqsd, -slop, -burstSlop, -done, -bootnum, -tag)
  filter(speciesEN == "Least Tern") %>% # keep only LETE
  collect() %>%
  as.data.frame %>% # convert tbl to data.frame
  # convert times to datetime
  mutate(ts = as_datetime(ts, tz = "UTC", origin = "1970-01-01"),
         tagDeployStart = as_datetime(tagDeployStart, tz = "UTC", origin = "1970-01-01"),
         tagDeployEnd = as_datetime(tagDeployEnd, tz = "UTC", origin = "1970-01-01"),
         year = year(ts),
         recvDeployName = as.factor(recvDeployName),
         mfgID = as.numeric(mfgID)) %>% # get year variable
  arrange(motusTagID, ts)
```

## 2.2 Importing Nesting and Tag Retention Data

We will import the nesting and tag retention data to determine incubation periods, at the same time converting variables to proper formats.

```
nesting <- read.csv("../data/LETE Nesting & Tag Retention Data.csv")
# rename some variables
nesting <- rename(nesting, mfgID = "Tag..", nestLat = "Latitude",
  nestLon = "Longitude")
# convert date to proper date format
nesting <- mutate(nesting, Date = as.Date(nesting$Date,
  tz = "CDT"), mfgID = as.character(mfgID))
# tags 132 and 120 are recorded together, need to
# separate
tag132 <- filter(nesting, mfgID == "132 & 120")
tag132$mfgID <- ifelse(tag132$mfgID == "132 & 120",
  "132", "")
nesting$mfgID <- ifelse(nesting$mfgID == "132 & 120",
  "120", nesting$mfgID)
nesting <- rbind(tag132, nesting)
```

To determine incubation period, each tag was assigned an end date based on the “Fate” variable, once a nest was categorized as either “failed nest”, “successful nest”, or “eggs due to hatch but no chicks found”, it was assigned an end date of that day; the “nestEnd” variable.

```
# get dataframe of nest end dates
nestEnd <- filter(nesting, is.na(Fate) == FALSE & mfgID !=
  "")
nestEnd <- select(nestEnd, mfgID, Date)
nestEnd <- rename(nestEnd, nestEnd = "Date")
# get dataframe of tag loss dates
tagLoss <- filter(nesting, Tag.Status == 2)
tagLoss <- tagLoss %>% group_by(mfgID) %>% summarize(tagLoss = min(Date)) %>%
  as.data.frame()
tagLoss$mfgID <- as.numeric(tagLoss$mfgID)
tags <- unique(select(nesting, mfgID))
tags$mfgID <- as.character(tags$mfgID)
tags$mfgID <- as.numeric(tags$mfgID)
tagLoss <- left_join(tags, tagLoss)
tagLoss$tagLoss[is.na(tagLoss$tagLoss)] <- as.Date("2019-01-01")
tagLoss <- tagLoss[!is.na(tagLoss$mfgID), ]
# join nest end dates to nesting dataframe
nesting <- left_join(select(nesting, mfgID, Nest_ID,
  nestLat, nestLon, Fate), nestEnd, by = "mfgID")
nesting <- unique(filter(nesting, mfgID != "", is.na(Fate) ==
  FALSE))
nesting$mfgID <- as.numeric(nesting$mfgID)
# join tagLoss to nesting dataframe
nesting <- left_join(nesting, tagLoss)
# join with lete database
lete <- left_join(lete, nesting, by = "mfgID")
# remove any detections after tag fell off
lete <- filter(lete, ts < tagLoss)
# label as incubating or not
lete$incubate <- ifelse(as.Date(lete$ts) <= lete$nestEnd,
```

```

    "TRUE", "FALSE")
# Tags 114 and 316 do not have incubation
# information and will be set to FALSE
lete$incubate <- ifelse(lete$mfgID %in% c(114, 316),
    "FALSE", lete$incubate)

```

Determine sunrise and sunset times for each detection based on detection location

```
lete <- sunRiseSet(lete, lat = "recvLat", lon = "recvLon")
```

Only detections that occurred during incubation will be kept, note that tags 114 and 316 do not have incubation information and will thus be excluded.

```
inc <- filter(lete, incubate == TRUE)
```

Examine how long each tag was detected for during incubation

```

detDate <- inc %>% group_by(year, motusTagID, mfgID) %>%
  summarize(mints = min(ts), maxts = max(ts), range = difftime(maxts,
    mints, units = "days"), nSites = length(unique(recvDeployName)))
# some birds not detected for very long, lets only
# look at ones detected for at least 1 full day
tmp <- unique(filter(detDate, range > 1)$motusTagID)
inc <- filter(inc, motusTagID %in% tmp)

```

Get a small data frame (lete.path) of hourly detections for easier data manipulation

```

# Hourly detections
fun.getpath <- function(df) {

## Chapter 3

# LETE Results

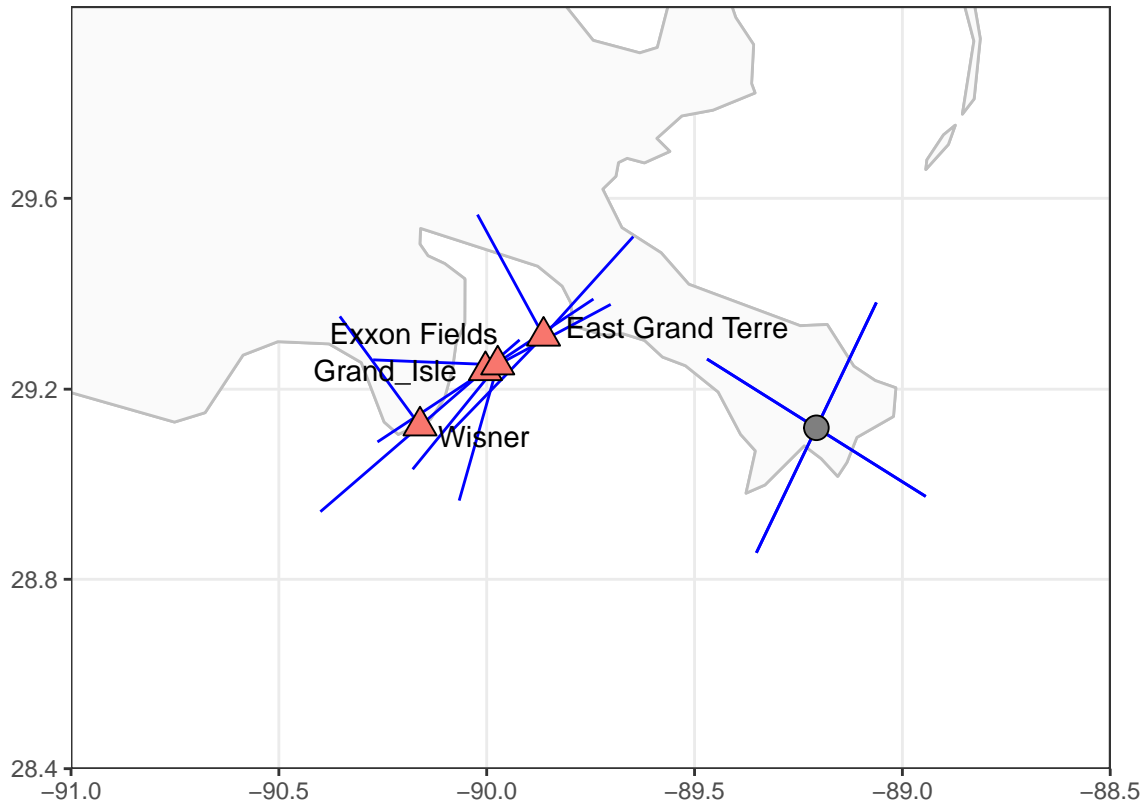

### 3.1 Study Area

Stations within the study region are presented below, grey stations had no detections, while red stations had at least one tag detected during the study period from 2017 to 2018. Triangles represent receivers that were active during 2017 *and* 2018, circles represent stations that were only active in 2017 (Quintana and East Grand Terre). The blue lines indicate the direction of antennas during the study period. All receivers maintained the same bearings throughout the study period with the exception of Bolivar\_Flats, here the solid blue lines are the 2017 bearings, while the dashed blue lines are the 2018 bearings.

\*\*\*\*\*ADD SCALE BARS TO ALL MAPS\*\*\*\*\*

All LETE were tagged within close proximity to Exxon Fields, and for the purposes of this report stations considered within proximity to the breeding area are Exxon Fields, East Grand Terre, Grand\_Isle, and Wisner. A close up of this area is below:

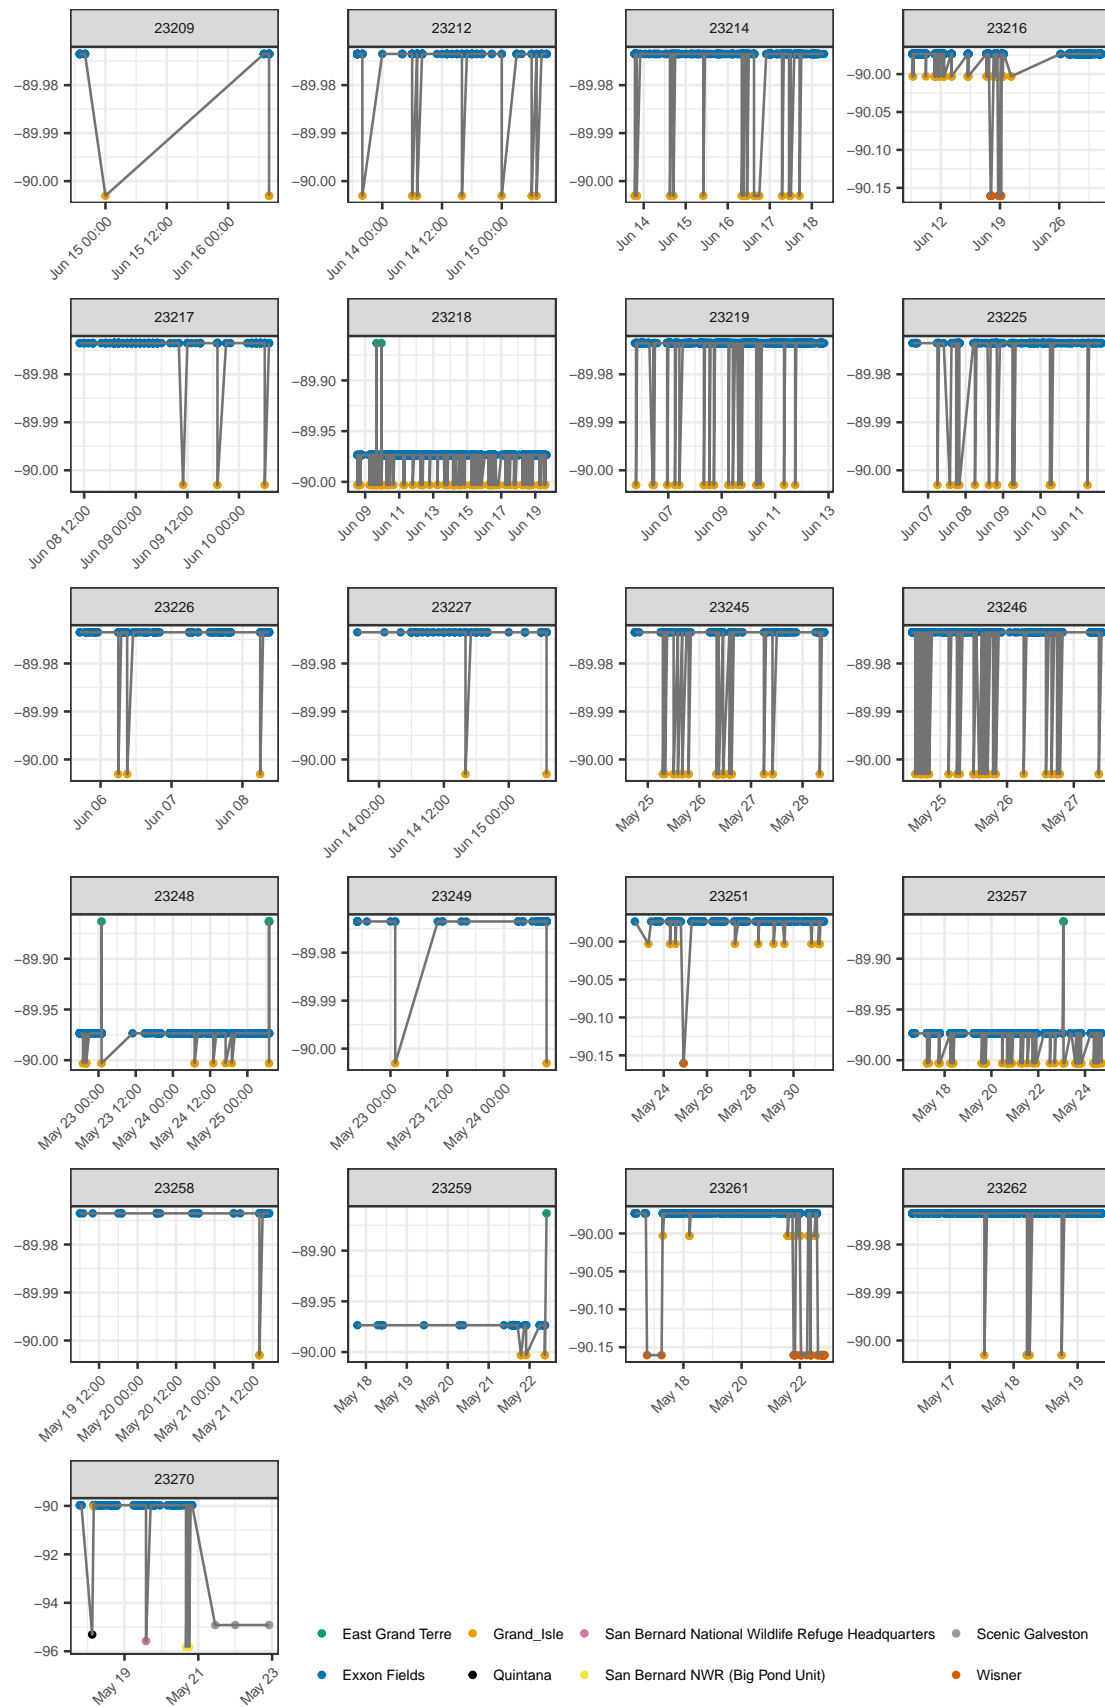

## 3.2 Detection Overview

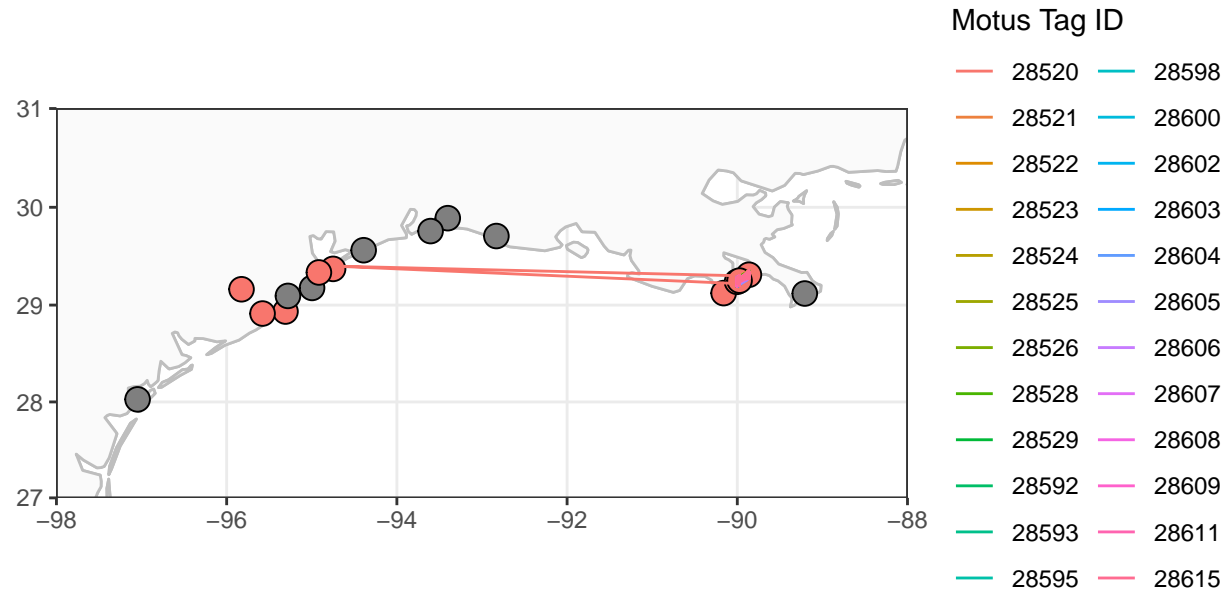

In 2017, only 1 individual (motusTagID 23270) was detected at stations outside the immediate tagging region, all other individuals and the bulk of the detections occurred at Exxon Fields, East Grand Terre, Grand\_Isle, and Wisner. The map below shows the detection pattern of all 2017 tagged birds, lines are coloured by tag ID.

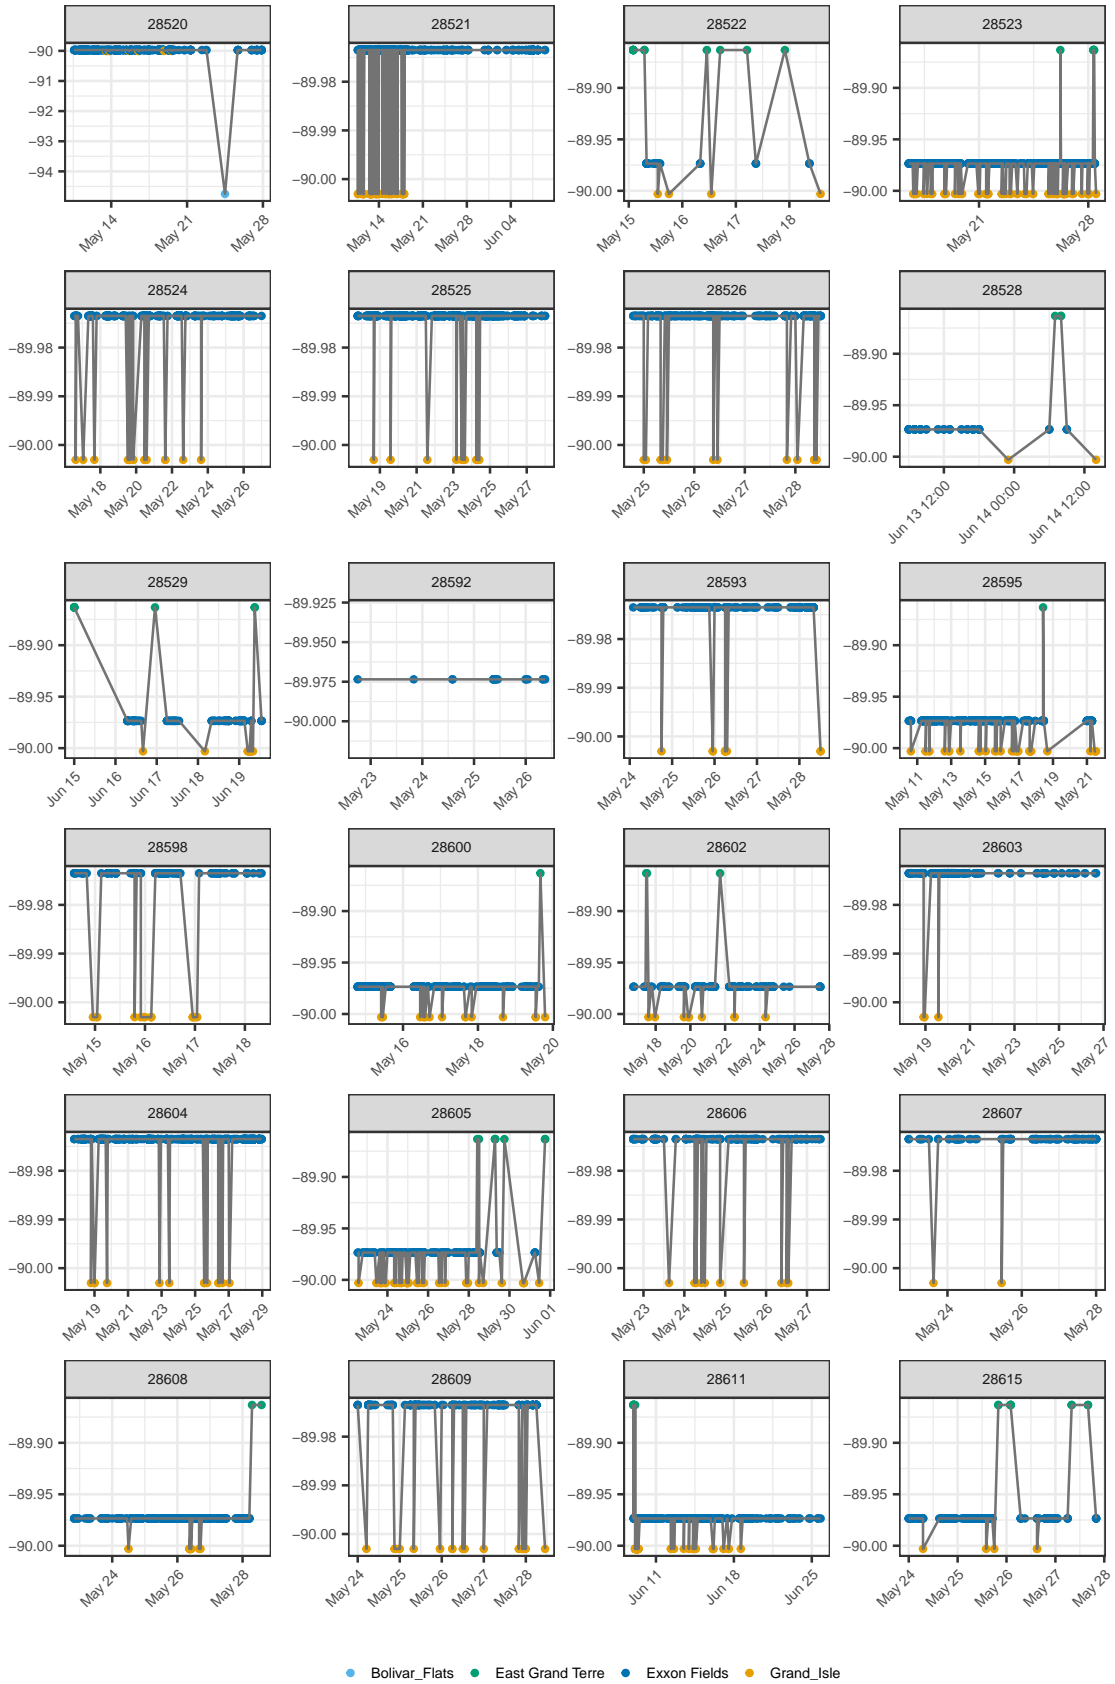

The plot below is the same 2017 data as mapped above, each plot is one individual's detections during incubation plotted as time by longitude, points are coloured by detection site. Note that x and y scales vary between plots.

In 2018, again only one individual was detected outside the immediate tagging region, all other individuals and the bulk of the detections occurred at Exxon Fields, East Grand Terre, Grand\_Isle. Note that in 2018 no birds were detected at Wisner, despite close proximity to nesting areas. Based on receiver performance outputs, this is likely due to receiver issues rather than a true lack of detections. The map below shows the detection pattern of all 2018 tagged birds, lines are coloured by tag ID.

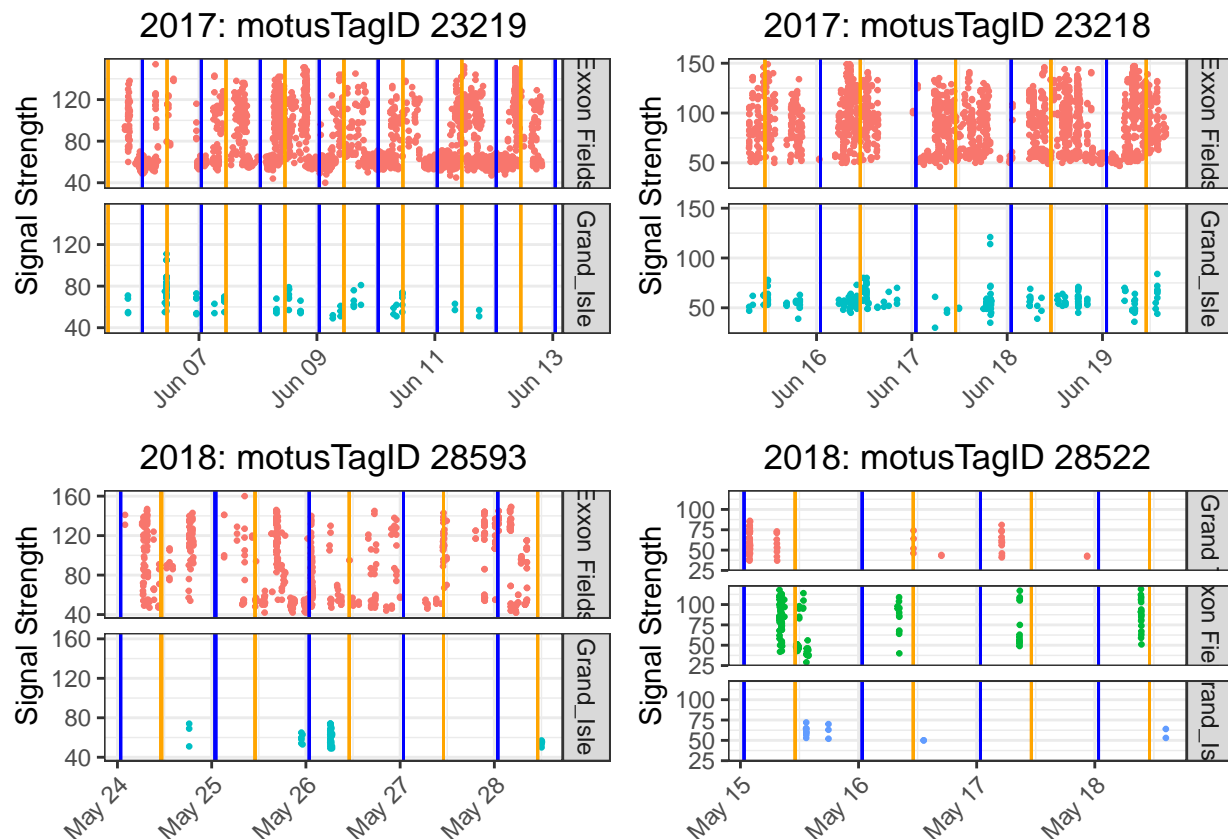

The plot below is the same 2018 data as mapped above, each plot is one individual's detections during incubation plotted as time by longitude, points are coloured by detection site. Note that x and y scales vary between

plots.

### 3.3 Foraging vs Incubating

The above plot is a selection of 4 representative detection patterns of individuals; examining the signal strength it is not always clear when birds are attending the nest site and when they are foraging. For example, tag 23219 shows clear daily signal strength patterns, with low signal strength occurring overnight when the bird is likely incubating. Tag 23218 has a similar but less distinct pattern, some nights the bird is detected while other nights it is not. In other cases the tag is picked up far less consistently as in tag 28593, and in even more extreme cases as in tag 28522. For these final two tags, the bird is rarely if ever detected while at the nest site, and most detections likely occur as the bird is leaving or arriving at the nest site.

Furthermore, even tags with clear daily detection patterns as in tag 23219, shorter nest site attendance periods during the day are not as obviously picked up. However, based on these detections, the signal strength during incubation is generally much lower than during flight. This is to be expected as a tags detection range increases substantially when a bird is in the air as compared to on the ground. Therefore, all detections on the Exxon Fields receiver with a signal strength < 80 will be excluded from foraging analysis from this point onwards to exclude likely detections on the nest. While this will invariably also remove detections on Exxon Fields that may occur when the bird is in flight, since the station is in very close proximity to the nesting site, in most cases this will only remove the tail ends of a detection streak as the bird is departing or approaching the nesting site.

### 3.4 Heavily Frequented Foraging Areas

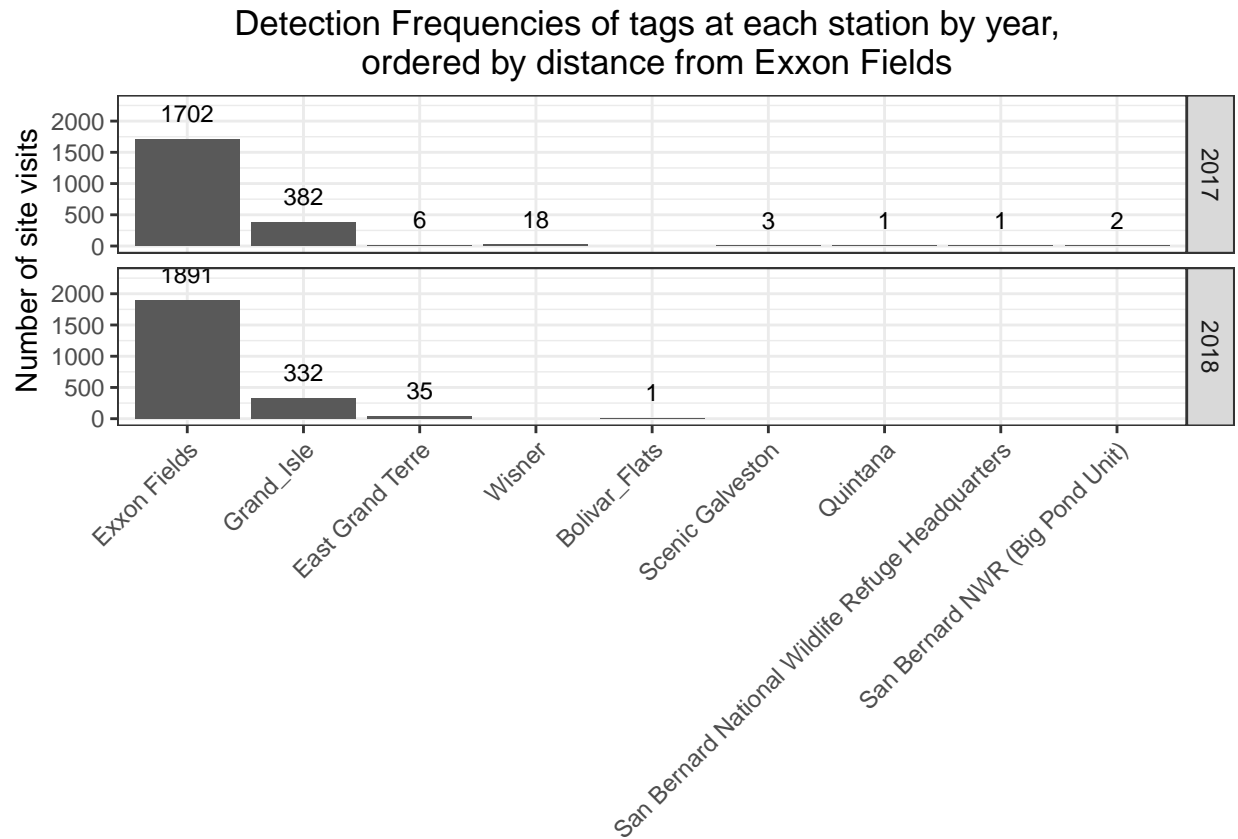

Detections were split into discrete site visits, a site visit was categorized as a set of consecutive detections of a single tag at a single station. To account for short periods of no detections within an otherwise continuous site visit, discrete site visits that were <10 minutes apart were lumped together to form a single site visit.

To add meaning to detection sites, the distance from Exxon Fields was calculated for each station where tags were detected and are presented below. A full database with distances calculated between all stations can be found in Appendix A.

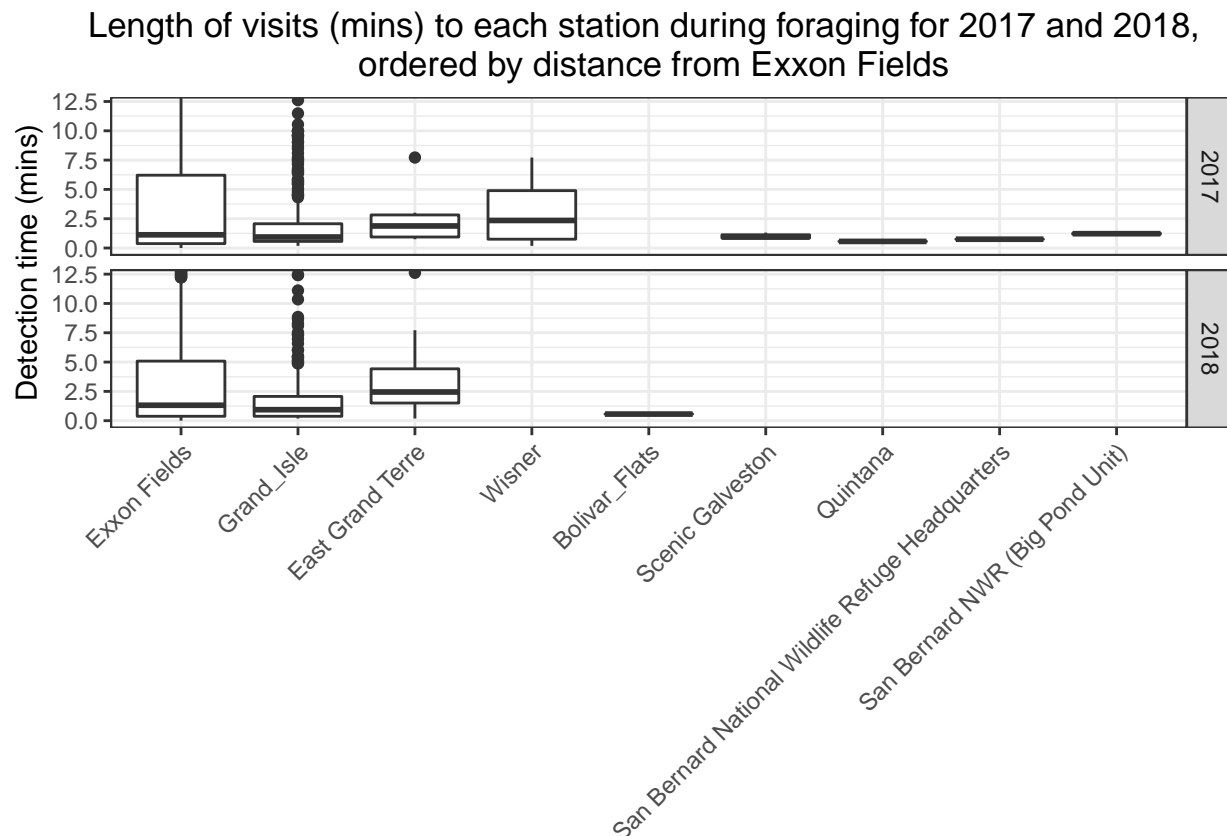

Site Name	Distance from Exxon Fields (m)
Exxon Fields	0
Grand_Isle	3166
East Grand Terre	12631
Wisner	23072
Rock W	281671
Sabine NWR	339660
High_Island	430034
Bolivar_Flats	464126
Scenic Galveston	480286
Brazoria National Wildlife Refuge	516442
Quintana	520551
San Bernard National Wildlife Refuge Headquarters	546935
San Bernard NWR (Big Pond Unit)	569092
Rockport Bay Education Center	704653

For each station the number of total number of visits was calculated, as expected Exxon Fields had by far the highest number of visits as it was at the nesting area. In 2017 and 2018 Grand\_Isle had the next highest frequency of detections, this is not surprising as it is the closest station to the nesting area. East Grand Terre and Wisner followed with lower numbers of site visits and are also near the nesting area. Note the lack of detections at Wisner in 2018, this is likely due to receiver malfunction rather than a true lack of detections. All other stations had negligible (<3) visits and are substantially farther away from the nesting grounds.

The length of visits was consistent with the number of visits, that is, birds generally had longer detection periods at Exxon Fields, followed by East Grand Terre, Grand\_Isle, and Wisner, only Grand\_Isle and Exxon Fields differed significantly in their visit length. The figure below shows the length of time each bird was detected at each site during each site visit, note that the plot has been cut off due to a high number of outliers, Exxon Fields had a maximum visit length of 61 minutes, Grand\_Isle 107 minutes, East Grand Terre 19 minutes, Wisner 27 minutes (See Appendix B for complete visit information).

Of the birds that were detected at Exxon Fields in 2017 and 2018, all were detected on at least 6 different visits. At Grand\_Isle, the majority (39/44, 88.6%) of birds were detected on more than 2 separate occasions (>2 discrete visits). In comparison, at the remaining stations less than half (10/23, 43.5%) were detected on more than two occasions. Only tags 23261 appeared semi-regularly at wisner but is notable in 12 detections.

Thus birds appear to spend the majority of their time in close proximity to Exxon Fields, however this could be a by-product of increased detection due to proximity to nesting sites and therefore a necessity to frequently pass the receiver regardless if foraging is occurring nearby or not. Most birds frequented Grand\_Isle regularly which could be due to nearby foraging, or a proximity to the nesting site. See Appendix ?? for detection plots of all birds detected more than twice on stations outside of Exxon Fields and Grand\_Isle.

\*\*\*\*\*NEED TO ADD THIS APPENDIX\*\*\*\*\*

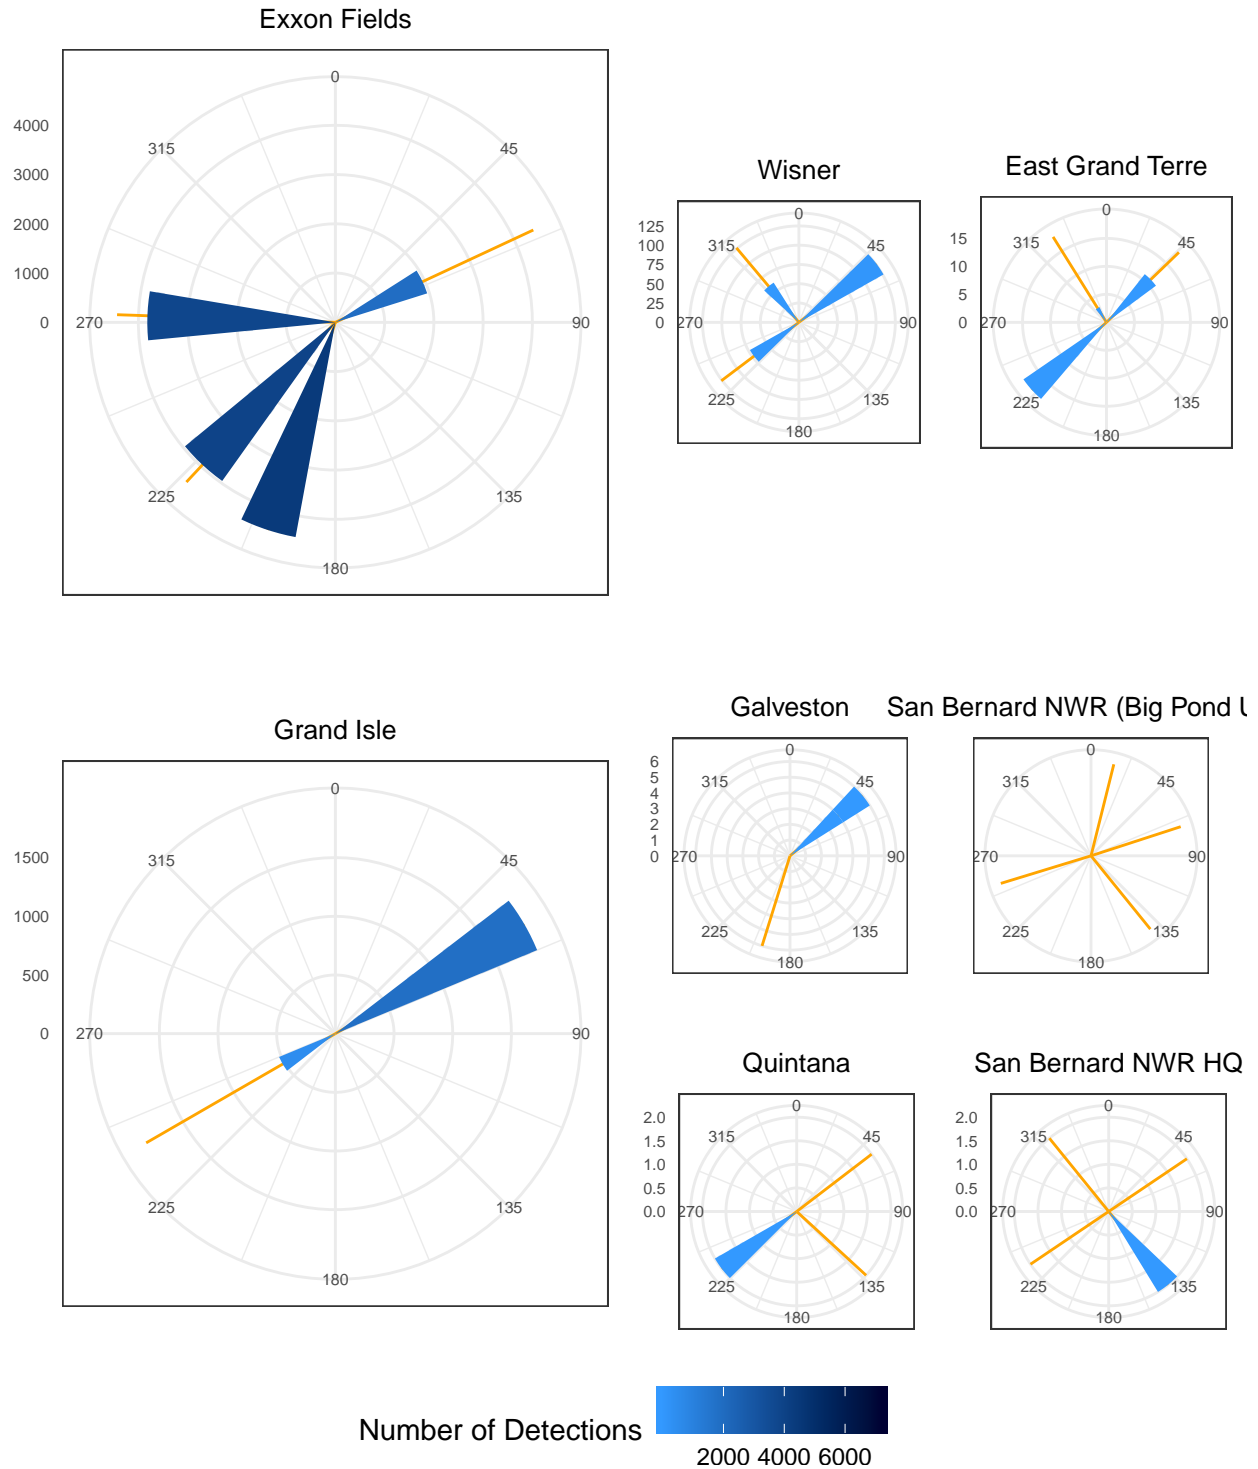

### 3.4.1 Simultaneous Detections

If stations are within close proximity of one another, it's possible to get simultaneous detections on both stations at once. During incubation there were 161 pairs of simultaneous detections, 2 of these occurred between East Grand Terre and Exxon Fields, 3 between East Grand Terre and Grand Isle, and the other 156 between Exxon Fields and Grand Isle. Exxon Fields and Grand Isle are the closest two stations at 3.1 km apart, easily within range of each other particularly when birds are in flight (see Appendix A). East Grand Terre is 12.6 km and 15.8 km away from Exxon Fields and Grand Isle respectively, the next closest pairs of stations.

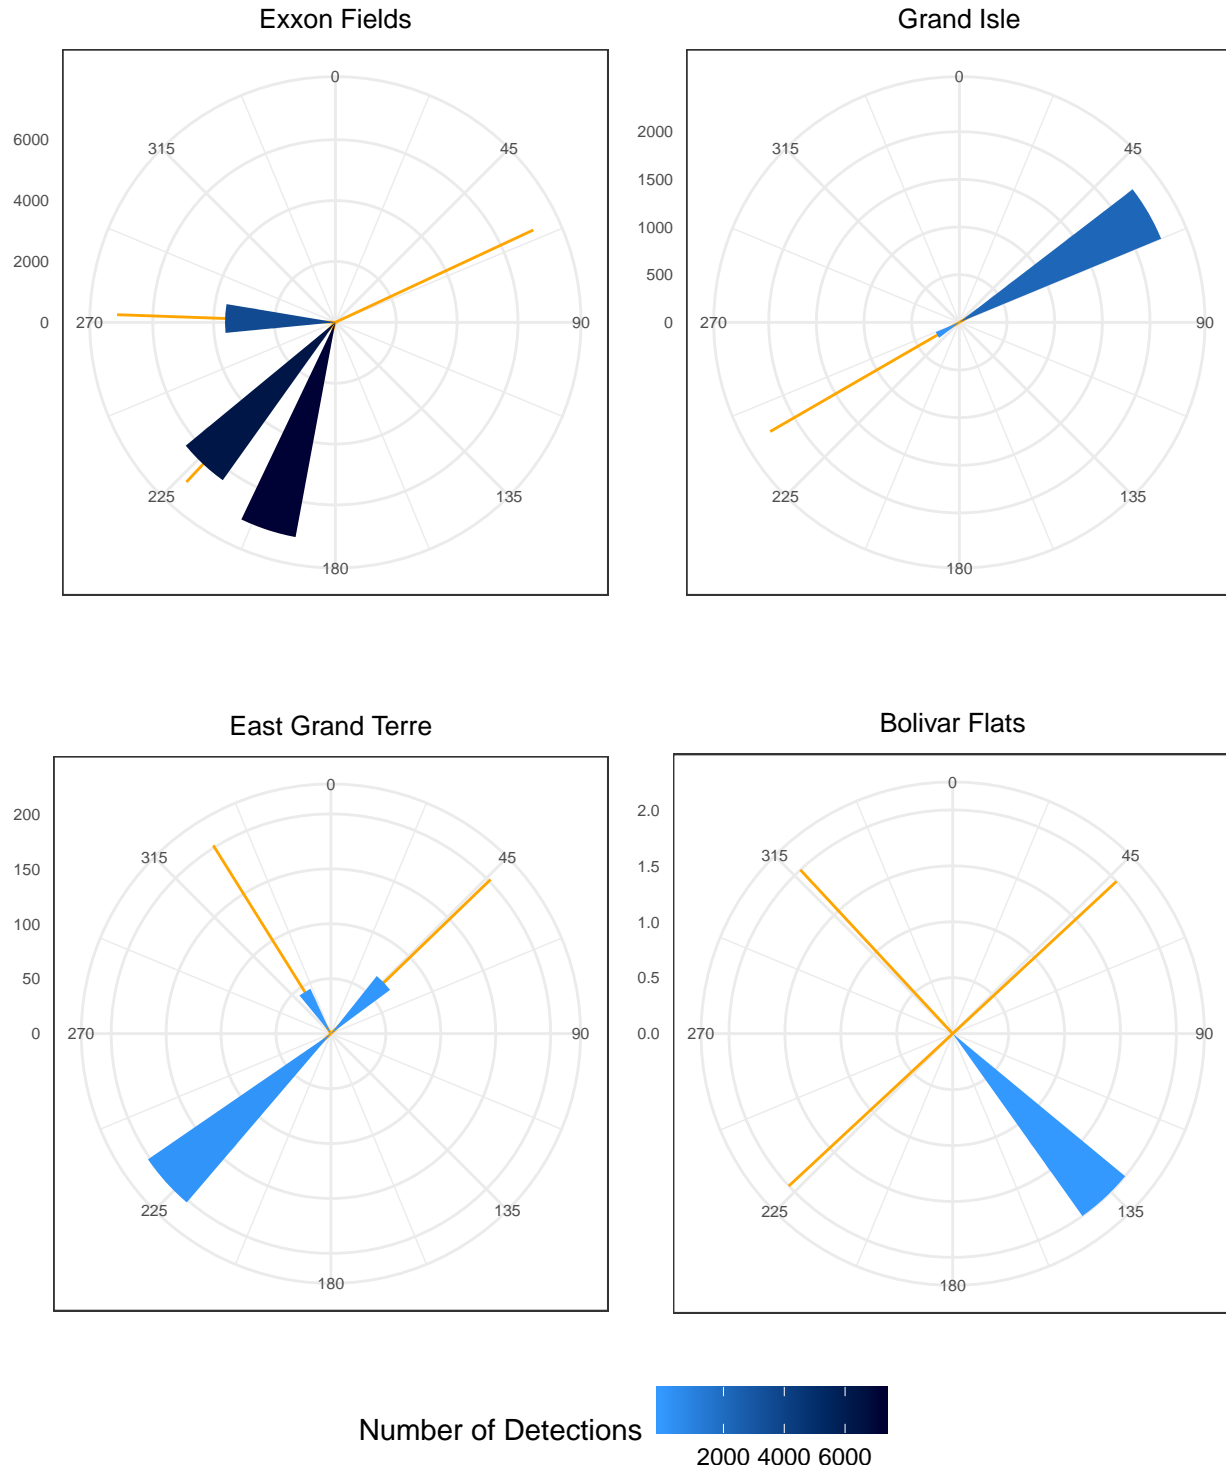

### 3.4.2 Detection Directions

We can narrow down the areas visited beyond which site they were detected at by examining which antenna they were detected on. The figures below show the total number of detections for each antenna bearing at each site for 2017 and 2018. Orange lines are the antenna bearings at each site, the blue bars are coloured by the number of detections on each antenna throughout the incubation period - note that scales differ by site.

## 2017: Number of detections by antenna bearing

## 2018: Number of detections by antenna bearing

Detection patterns are similar at Exxon Fields, Grand Isle, and East Grand Terre in 2017 and 2018. Detections at Exxon Fields were predominantly to the SW, directly in line with the tagging area, this also indicates that birds likely arrive and depart to/from the nesting location from the SW. Grand Isle detections were overwhelmingly more prevalent to the NE, pointing towards the nearby colony, while this may indicate that birds don't spend much time foraging to the SW, it could also be due to the sheer proximity of the nesting

site. As discussed earlier, nearly all cases of simultaneous detections between two stations occur between Exxon Fields and Grand Isle, suggesting that many of the arrival and departure flights from the colony could be captured by both stations, resulting in the high number of NE detections at Grand Isle being an artifact of colony attendance. East Grand Terre had the most detections by far to the SW, again towards the colony.

In 2017, birds were picked up in very small numbers outside of the immediate breeding area. It is difficult to make generalized assumptions from such a small number of detections, however it does seem as though a few birds may be using the areas off the coast around Quintana. There are even fewer detections away from the colony during incubation in 2018, but those that do occur are in the same region.

### **3.5 Mean Distances Travelled for Foraging**

Based on detection data, in 2017 the mean distance travelled for all detection periods was 2.5km, with a maximum distance travelled to San Bernard NWR (Big Pond Unit) at 569.1 km. In 2018 the mean distance travelled was 0.86 km, with a maximum distance travelled of 464.1 km to Bolivar Flats. However, the vast majority of detections (4,366/4,374 or 99.8%) during foraging trips occurred within 23.1 km from the colony detected at the four closest receiver stations (Exxon Fields, Grand Isle, East Grand Terre, and Wisner).

### **3.6 Time Partitioning Between Foraging and Nest Site Attendance**

## Appendix A

# Appendix - Distances Between Receivers

The following table lists the latitude and longitude for each pair of receivers, and distance (m) between them:

X	recvDeployName1	recvDeployName2	recvLat1	recvLon1	recvLat2	recvLon2
1	Bolivar_Flats	Bolivar_Flats	29.37	-94.75	29.37	-94.75
